

I am against this deployment. I have been fighting a similar issue regarding noisy computer power supplies radiating via the power grid. My receiver is totally useless with these signals. Wideband hash as well as carrier spurs all up and down the ham bands. I have requested help from the power company on this issue. The result was total lack of manpower to handle this. One employee had the skills for the rfi for the entire company of 10000 + . The power companies are not ready to handle the problems, they just want the income.
